Reads

Illumina Sequencer

Applications

Whole Genome Sequencing

Predicting antimicrobial resistance

1. Information on resistance mechanisms
 - Acquired - Example: *mecA*
 - Chromosomal mutations - Example: *gyrA* mutations
 - Resistance databases: **CARD, ResFinder and AMRFinder**
2. Whole Genome Sequence
3. Analysis and interpretation tools

Antibiotics

a Antibiotic targets in bacterial cells

Resistance mechanisms

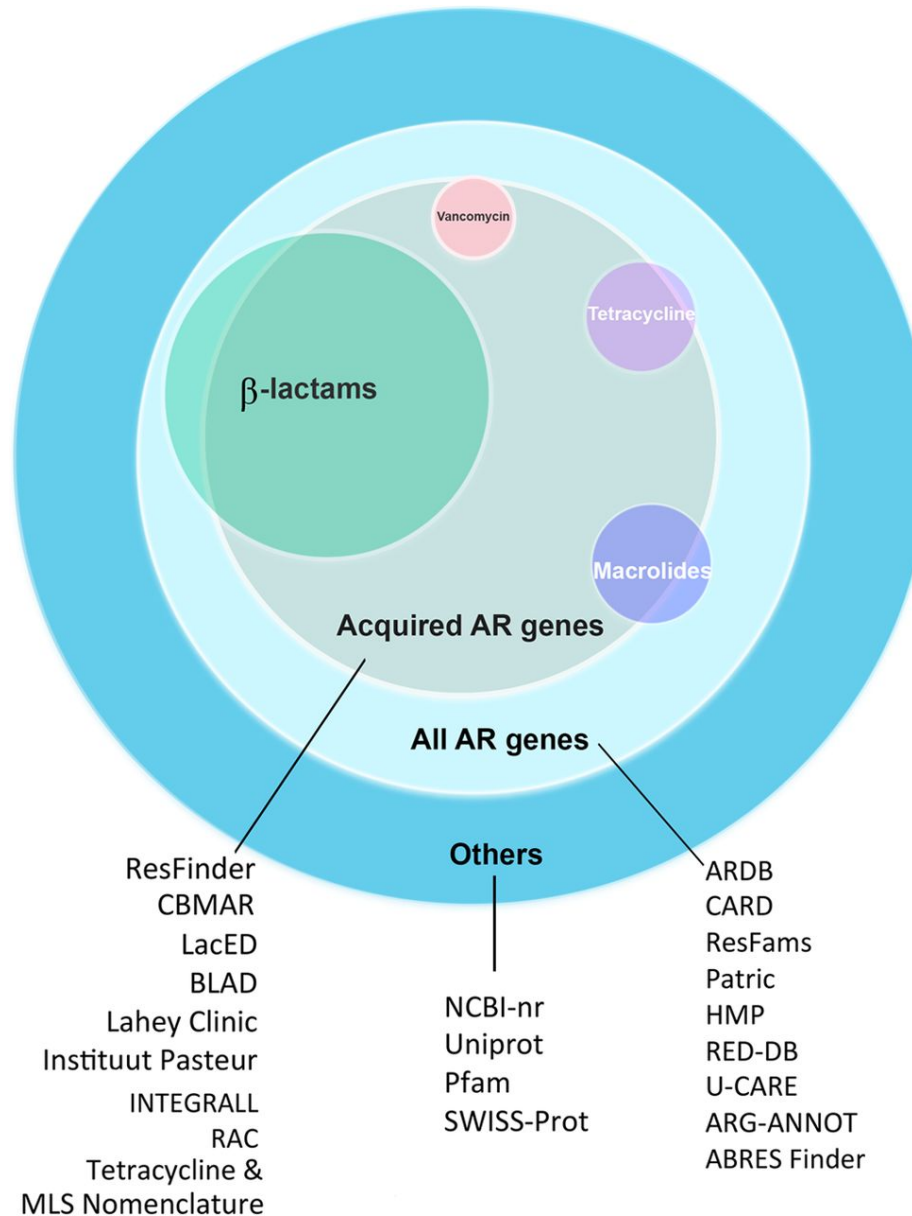

b Mechanisms of antibiotic resistance

c Genetic determinants of resistance

Antimicrobial resistance databases

Predicting phenotypic resistance

AMRFinder (*Feldgarden M et al. 2019*):

Validated on 6,242 isolates across 3 different species
concordance >98%

Mycobacterium tuberculosis (*Hunt et al. 2019*):

validated against 10207 isolates
concordance 94%

Staphylococcus aureus (*Kumar N et al. 2020*):

validated against 778 isolates
concordance 99%

CARD

- Determinants from 263 pathogens (N > 100,000) genes, SNPs and plasmids
- Gene ontology structure (6453 GO Terms) for characterization
- Uses both BLAST, homology and SNP models
- latest versions with Kmer based algorithms
- Integrated within easy-to-use webtool

Usage considerations:

- Results need to be filtered based on the cutoffs used (manual curation)
- Species nonspecific predictions
- Prediction limited to class of drugs in certain instances
- Limited upload size not suitable for large scale usage
- Accepts only assembled sequences

ResFinder

- Reference database contains 2919 genes, 266 SNPs and >57 antimicrobials
- Regularly curated and updated
- Uses Kmer based algorithms
- Integrated within easy-to-use webtool and command line version also available

Usage considerations:

- Species specific predictions
- Minimal curation of the results needed
- Prediction limited to class of drugs in certain instances
- Can accept multiple sequences at a time
- Accepts both assembled sequences and reads

AMRFinder

- Reference database contains 4579 proteins, 560 HMM
- Regularly curated and updated maintained by NCBI
- Allows identification of potentially novel mechanisms

Usage considerations:

- Command line only tool
- Results include drug class
- Can accept multiple sequences at a time
- Accepts assembled sequences

Detecting resistance

Prediction tools

Prediction tools	Databases used
<i>Web tools</i>	
Pathogenwatch	own
ResFinder	own
CARD-RGI	own
<i>Command line tools</i>	
NCBI AMRFinder	own
ResFinder	own
SRST2	Derived from ARG-ANNOT
ABRICATE	ResFinder, CARD, AMRFinder, PlasmidFinder, VFDB

Considerations

- Input files reads/assemblies
- Comprehensiveness
- Curation
- Regularly updated
- Easy to access
- Comparability
- Discrepancies between phenotype and genotype
